

140 kWh photovoltaic energy storage system

140 kWh photovoltaic energy storage system

Newly constructed commercial buildings in California are now required to add solar and battery storage systems. On January 1, 2023, the California Energy Code instituted the requirement, updating the Building Energy Efficiency Standards for residential and commercial properties, as part of its push to obtain 100 percent carbon neutrality by 2045. The Energy Code is updated every three years, including energy and water efficiency requirements for new buildings and modifications for existing buildings.

Solar requirements depend on the building type, size, and climate zone. The minimum required size of the solar system and the coefficient according to the California climate zone will determine the sizing requirements for the storage system. Any newly constructed building that is any of the above building types must adhere to the new solar PV and storage system building standards.

As developers work to meet these requirements for new construction buildings, there are several things to consider. Solar and energy storage systems must be on the CEC-approved hardware equipment lists and meet the established national safety and performance standards. Acumen EMS[®] is integrated directly with several hardware manufacturers, including BYD, Tesla, and Socomec that are on the CEC lists and compliant with the necessary standards. You can find those lists below:
