

Agile octopus battery

Agile octopus battery

Hi all, I'm the developer of Netzero, an app for managing solar and battery systems. I'm currently working on automatic tariff configuration for Tesla Powerwall systems: automatically adjusting the Powerwall tariffs to follow the the dynamic pricing of Agile Octopus and similar tariffs.

I've been running the octopus compare app for atleast a week now and as you can see there's a significant saving on Agile over Intelligent. However the prices on agile have been very low over the past week compared to the weeks prior to this.

Do I stick with Intellient or move over to Agile? I suspect by end of feb/march i'll be off-grid as currently by 10am solar runs the house consumption (2 kids on games consoles + base load)

Edit: but more background, I have to charge the car almost every day. We usually run the dishwasher and washing machine at night if we can, however we have a 3yo in the house and so sometimes it is unavoidable to have to use appliances when we need to. Also, obviously we have to cook somewhere between 5 and 6pm right in the peak times, as his bed time is 7pm -7.30.
