

Battery backup systems power outage

Battery backup systems power outage

There is much to consider when choosing which kind of backup power you need during a power outage or when you use off-grid backup power. To determine if a backup power generator system, uninterruptible power supply, or a battery is right for your home, you need to know the pros and cons of emergency generators or home battery backup systems for your home or office to maintain power supply until utility power is restored.

You'll also need to consider whether you want to buy a gas generator, diesel generator, air or liquid-cooled, fixed standby generator, or a portable generator. Do you want a seamless switch to emergency battery power, fed by solar, or will a portable air-cooled generator fulfill all of your needs?

Comparing the differences between a generator and a battery backup for your home power supply can be less of an onerous task if you have first carried out a detailed energy audit so that you know how much power you will need during a power failure.

To work out how powerful your battery backup system, standby power system, or home backup generator needs to be, carry out an energy audit by calculating how much power your appliances use. Once you have the details from your energy audit, you can decide to choose which system will be best for your home or office and whether you prefer a battery backup system or a generator.
