

Battery lifespan remaining

Battery lifespan remaining

If you want to see the estimated time remaining on Windows 11, navigate to Settings, select System, and click on Power & Battery. Information on the estimated time remaining is available under the battery percentage. You may need to wait for 30 seconds until these details show up on the screen.

Alternatively, you can also use a stand-alone battery app to track battery performance. For example, if you own a Dell computer, you can use the My Dell app to check the battery's remaining hours.

Being able to see how much battery time you've got left is crucial, especially when you're traveling and there's no power outlet nearby. Many users agree that checking the estimated battery time on the taskbar by hovering your mouse cursor over the battery icon is much more convenient than navigating to the Settings page.

Microsoft probably removed the estimated time remaining option because it was not an accurate measuring tool. As a quick reminder, the estimated time remaining was constantly recalculated on Windows 10, depending on your load. Unfortunately, that was never an accurate representation.

By design, Windows 11 no longer shows the estimated battery time remaining when you hover over the battery icon on the taskbar. To check the estimated time remaining on Windows 11, go to Settings, select System, and click on Power & Battery.

Madalina has been a Windows fan ever since she got her hands on her first Windows XP computer. She is interested in all things technology, especially emerging technologies -- AI and DNA computing in particular.

Battery life has always been a running joke with Windows PC's. The PC makers grossly overestimate battery life, and Windows does a terrible job at monitoring battery life. I think most feel that estimated times never properly reflect actual time so 2 hours left never really ends up being 2 hours actual time. Percentage seems more average and not so time specific. How this metric became less accurate is a big question mark. But maybe battery life isn't improving much so they try and hide that fact.

Poor understanding of user needs by Microsoft. Why wouldn't anyone not want to know how much battery they have left on a laptop. Crazy decision. I can be working and the laptops just shuts down, no warning leading to lost work and major frustrations. YOU GOT IT WRONG MICROSOFT. Give us our battery meter on the taskbar notifications back!

Microsoft is silly in making changes for the sake of making changes. They have idiotic searching Paper Clips then they do not. They have searching Puppies then they do not. They needlessly change things around to give the appearance of improvement. This results in a complete waste of time with each OS.
