

Bosch Car Service

The braking distance is unnecessarily long. There is an increased risk of tire damage caused by excessive heat generation. Fuel consumption rises due to the greater rolling resistance.

Do you tend to use a high-pressure cleaner on your car? If so, it is important to take particular care when cleaning the tyres. A concentrated jet of hot water from close range can cause considerable damage, as the pressure on impact causes the temperature of the tyre material to increase and small blisters to form in the rubber, thus weakening it. Weakened rubber runs the risk of the sudden bursting of tyres under heavy load or at high speed.

Maintain a distance of at least 20 cm between the end of the gun and the tyre. Use a wide-spread rather than a concentrated jet. Even in the event of stubborn dirt, never direct the jet at a single point but rather move it constantly back and forth.
