Diamond solar salt ghana

Granular salt is a type of salt usually made up of small, hard grains that feel slightly gritty when rubbed between the fingers. Granular salt is often produced using the solar evaporation method, where seawater or brine is exposed to the sun and wind to facilitate the crystallisation process.

In industrial settings, granular salt is used as an essential ingredient in the manufacturing of products like detergents, soaps, and bleaching agents. It is also used in water softening systems to remove hard minerals, and as a feed additive for livestock to provide essential nutrients and promote growth.

At Electrochem Ghana Limited, the production of granular salt as industrial solar salt involves a careful process to ensure quality and consistency. The company's state-of-the-art facilities and advanced techniques allow for precise control over the production process, resulting in a high-quality product that meets the needs of various industries.

Crystal salt is a type of salt that is recognizable by its large, clear, and faceted crystals. Crystal salt is known for its natural purity and is often used for industrial and medicinal purposes.

Electrochem Ghana Limited produces crystal salt as industrial solar salt, which involves the process of evaporating seawater or brine using the energy of the sun. Crystal salt is a highly versatile product and is used in the manufacturing of a wide range of products, including chlorine, caustic soda, and other chemicals. It is also used in the food industry.
