In order to achieve the maximum charging speed, EV6 must be charged at an 800-volt electric vehicle charger

Electric car battery life

that delivers at least 260kW of electricity. EV9 must use an 800 volt electric vehicle charger that delivers at least 210kW of electricity. The additionally added real-life range within 15 minutes is depending on different factors including the current state of charge of the battery, battery temperature, exterior weather conditions and the charger used. It is also defined by the individual driving style and energy consumption.

The range was determined according to the standardised EU measurement procedure (WLTP). The individual driving style and other factors, such as speed, outside temperature, topography and the use of electricity-consuming devices/units, have an influence on the real-life range and can possibly reduce it.
