

Electric vehicle safety ankara

Under the Social Economy Financial Support Program focusing on Sustainable Development Goals (2022), a contract has been signed for the project titled "Electric Vehicle Maintenance Simulator Project," offered in partnership between the Automotive Engineering Association and OSTIM Technical University.

The Communiqué serves the purpose of regulating the import of electric vehicles belonging to non-European Union member states and Free Trade Agreement non-signatory states specified below with customs tariff statistical positions ("TARIC") codes and commodity descriptions. These updates are in line with the import regime decision and involve consultations with relevant institutions.

A key change instituted by the Ministry of Commerce states that a "Permission Certificate" from the Ministry of Industry and Technology is now essential for the import of electric vehicles not originating from the European Union and Free Trade Agreement territories.

The new regulation aims to improve consumer safety, after-sales service quality, and ensure effective management of electric vehicle ecosystems, including battery parks, charging stations, power management, and battery recycling processes.
