

Energy storage market ecuador

Even though the solar PV market in Ecuador is virtually non-existent, with only a few projects operational and mostly in the distributed generation market, it is about to take off, says Jos? Luis Garc?a P?rez, Latin America's CEO at Spanish developer Zelestra, formerly known as Solarpack.

"In Ecuador, projects are from distributed generation with, until recently, sizes of up to 1MW. The government increased the threshold to 2MW for self-consumption," explains Garc?a P?rez.

Ecuador would have found it very complicated to reach its decarbonisation targets with only distributed generation, so it launched tenders to seek utility-scale capacity, explains Garc?a P?rez. Through one of these tenders, the Spanish developer is to build the country's largest solar park, with a capacity of 200MW. The El Aromo PV project is located in the coastal region of Manab?, with a 20-year offtake agreement with the Ecuadorian government already secured.

"This will allow for other developers that participated in last year's tender to be built. The renewables utility-scale market in Ecuador is starting to take off," says Garc?a P?rez.

Zelestra has been present in the Latin American market for a while now and includes a portfolio of solar PV projects in Chile, Peru--where it is constructing the 300MW San Martin solar project, Colombia--finishing two projects of 252MW combined capacity, La Uni?n and La Mata--and Ecuador with a tender won in 2020 for the construction of a 200MW solar PV plant. Mexico has an amazing base for developing renewables, yet the country is not on Zelestra's radar, says Garc?a P?rez.

Garc?a P?rez expects Ecuador's renewables industry to become increasingly attractive to developers for two reasons. For starters, it is a dollar-led market, which will make it easier to finance a project and reduce any possible currency volatility issues, explains Garc?a P?rez.

Secondly, Ecuador is a country which is expected to experience electricity demand growth. A demand growth that will be led by the mining industry, which will be required to be powered through renewable energy capacity. Garc?a P?rez highlights the possibility for Ecuador to experience what Chile did with its own mining industry. A country that is at the forefront of solar PV in Latin America, only behind Brazil, in terms of installed capacity.

This is coupled with the country's current deficit in installed capacity, which was noticeable last year due to a lack of electricity generation caused by the effects of the climate phenomenon El Ni?o in 2023, adds Garc?a P?rez. To subsidise this problem, the country aims to increase its share of renewable energy capacity in the coming years, making it an attractive market for the renewables industry, says Garc?a P?rez.

One of the main challenges when entering a new market, and more specifically, one where utility-scale solar PV is not developed, is that it will be harder to find the right partners to build a new project.

However, Garc a P rez highlights how, for a project in Colombia, the company brought a Peruvian partner to build one of its projects while the industry grows in the country. "Transferring knowledge when you're starting in a new country is a bit harder," says Garc a P rez, adding that once that work is done for the first few projects, the following ones will be much more efficient and faster.

Although building projects in a country which still lacks knowledge or skilled workers to develop the projects, the know-how of neighbouring countries in solar PV, such as Chile and Peru, will be helpful to add PV capacity in Ecuador.

The same goes for establishing the financing structure; specifically power purchase agreements, which, in Ecuador, needed to be discussed with the Ecuadorean authorities to make the project financially viable.
