

## Ghana electricity sources

Increasing environmental concerns and consumer demand for green power make hybrid and microgrid power more popular than ever. A hybrid microgrid combines two or more power sources, often including renewables, and is an optimum solution for achieving optimum power system reliability and resilience while cutting carbon emissions, saving fuel, and reducing maintenance requirements.

DEIF offers intelligent and reliable control solutions for a wide range of greenfield and brownfield hybrid applications, allowing you to design green and reliable power solutions that can be scaled and reconfigured as required and which can include fossil and renewable power sources plus energy storage.

Our extensive manufacturing capacity allows us to meet any volume demand - regardless of geographical destination. We work hard to make sure our customers receive orders as quickly as possible, and we ship standard products in less than 7 days.

We manufacture all our products in-house at our Danish HQ in Skive to ensure we continue to meet demand and reduce customer lead times. So if you are struggling to get hold of control products through your usual supply channels, there has never been a better time to talk to DEIF.

The Norwegian energy industry is a key export sector and a driver of green transition in Norway and abroad. Eksfin offers long-term financing and AAA-rated guarantee solutions for exporters, foreign buyers, and projects that use Norwegian services and technology in renewable energy such as offshore wind power, solar power, and hydropower, field development, and alternative energy sources. In addition, guarantee solutions are offered for industrial stakeholders in need of long-term power purchase agreements in Norway.

Risk relief for loans for investments in Norway is also available to subcontractors to Norwegian exporters who can demonstrate substantial indirect export revenues. Furthermore, Eksfin manages a separate Norwegian scheme for risk relief in connection with the conclusion of long-term power agreements in Norway.

Eksfin can offer favourable financing packages with both long-term financing and risk-relief guarantees in connection with all projects related to alternative energy solutions. These can include CO2 capture and sequestering, hydrogen, ammonia, etc. Fixed interest rate options and long maturities make export financing an attractive element in financing solutions for renewable energy projects.

Industrial companies with high electricity demands may need to enter into long-term power contracts in order to get a more predictable price. Eksfin can offer guarantees to help reduce the buyer's and power seller's risk related to the conclusion of a long-term contract. This risk relief is only available to industrial companies registered in Norway who operate in wood processing, metals, and chemical products and who wish to enter into agreements with Norwegian power companies.
