

Home wind turbines uk installed

You already know plenty about solar panels and heat pumps - but have you considered home wind turbines? With rising energy costs and the increasing importance of sustainability, more people are turning to renewable energy solutions like a wind turbine for home use.

If you're considering this eco-friendly way of generating power, this guide will answer your key questions about home wind turbines, from how they work to the costs involved and the different options available.

There are many reasons to do it. For example, installing a wind turbine at home can significantly reduce your dependence on traditional electricity sources, lower your energy bills, and contribute to reducing carbon emissions.

Energy is transferred to a generator: As the blades turn, they spin a rotor inside the turbine. This rotor is connected to a generator, which converts the kinetic energy of the wind into electrical energy.

These are designed to work well in turbulent wind conditions and can be mounted lower or even on rooftops. They're less efficient than HAWT but more suited for areas with inconsistent wind patterns.

Depending on the domestic wind turbine you opt for, you need to work out the savings to decide if it's worth it. For example, at the upper end you could be spending ?70k on a freestanding home wind turbine.

Over the lifetime of the system, you could save thousands of pounds, and if you're eligible for export payments under schemes like the Smart Export Guarantee (SEG), you can even sell excess electricity back to the grid.
