

How Many Batteries For a 3000 Watt Inverter

How Many Batteries For a 3000 Watt Inverter

In solar panel systems, the inverter usually draws power from a battery bank to run appliances. So if you have a 3000 watt inverter, how many batteries or what size will you need? The answer is not as difficult as it seems to figure out as we will show.

The same inverter will run at full power for an hour so on a 125ah 24V battery. Many inverters support 24V batteries, and while these batteries cost more you can get by with a smaller capacity.

A battery bank is mandatory for an off the grid system. But some grid tied homes prefer to have a battery bank just in case the power goes out. Solar power in grid tied systems are shut down automatically during a power outage for safety reasons, but with a battery bank you run basic appliances.

In the examples above the assumption is the inverter runs with a full load for one hour. For other scenarios you can use the following calculations, and they are applicable for any battery voltage.

If you can get a 12V 450ah battery bank that is good, if not you can get any combination as long as the total is at least 450ah. A couple of 250ah batteries will do for instance. The same rule applies for 24V batteries.

But as pointed out previously, these are the minimum sizes. Running the inverter with these loads will result in a full discharge. That is not recommended for deep cycle batteries, as they have to be recharged at the 50% level.

If you need to run those loads mentioned above, you have to double the capacity. So instead of 450ah 12V for a 1800W load, make it 900ah. And you should get a higher battery capacity because a low inverter efficiency rating will mean a higher power consumption.

The lowest acceptable inverter efficiency rating is 85%, with newer ones at 90% to 95%. As we will explain, the rating is the reason why calculations for inverter runtimes are estimates at best.

Assuming the inverter has at least a 500ah battery bank, it should be able to run a TV, movie player, lights and a fan at the same time for hours. You can run a laptop, printer, speakers and lights without a problem.

3000 watts is enough to run some power tools, kitchen appliances and some motors as well. A room air conditioner needs 1500 running watts and 2000 surge watts, so it is not a problem either.
