

iPhone 12 ????

If you don't have the original disassembly kit, be really careful with the LCD, it's as crunchy as anything. Heat a lot (100-120C) and if you're careful, a few drops of isopropyl will dissolve the annoying double-sided tape - but don't pour it there (you'll destroy the display), just a few drops and always wait a bit and move the pry bar. Most pry bars for separating the LCD from the frame are very thick, it is better to use durable foil, metal plates or high-quality paper playing cards.

Before gluing it (I recommend the original gluing kit), carefully clean the surfaces so that there are no old tape clumps and verify all functions. Do the programming of the original battery on the disassembled piece and all tests including face ID, SIM card, vibrations, if you play with shuffling electronics and JCID cable.

biggest mistake of my life first i had bough a used phone that got repaired then the battery went inflated and then i bough the set and all things werent origial like the speaker and other things so stupidddd..... then i PAID 40 DOLLARS I WOULD EVEN GO TO A APPLE STORE TO PAY 100 TO GET IT FIXED OMG ONE TIME AND NEVER i was sitting at the cold ass winter breeze out and got almost freezed im not gonna do that anymore and brake my body
