

Inverter control board

Siemens is a market leader in the HVAC industry, focusing on the development of systems and applications for vertical market areas with unique requirements that necessitate highly customised solutions.

Siemens products meet the highest quality standards, from valves and actuators to sensors and thermostats. Every single one of our products has key attributes such as energy efficiency, ease of handling, and lengthy lifecycles.

Open communication standards such as KNX and BACnet improve interoperability and make smooth integration into building automation and control systems possible - this is how perfect places become a reality. Our portfolio provides you with all of the products you require from a single source. For each product, you benefit from standardised installation techniques and simple engineering.

The sensors are standard control components that are used to monitor one or more specified fluid variables. If one of the major functions of an HVAC system is to maintain a high level of air quality, the ahu sensors are critical because they monitor the state of the area to guarantee that the HVAC system's performance meets the appropriate criteria.

An active sensor is a sensing device that operates with the help of an external power source. Active sensing devices collect data about the environment and convert it to a digital signal that may be sent to the control. The value from the sensing device will subsequently be converted into a temperature reading by the controller.

Electronic expansion valves are designed to suit any cooling capacity requirements in air-conditioning and refrigeration applications, and they excel in flow control even at low flow rates. For more technical info, our IACS team is available to respond to any enquiries.

The expansion valve relieves pressure on the liquid refrigerant in the evaporator, allowing it to expand or change state from liquid to vapour. The hot liquid refrigerant entering the expansion valve is high-pressure liquid refrigerant. Feel the liquid line at its connection to the expansion valve to confirm this.
