

LATEX FOAM RUBBER PRODUCTS

Unlike many of our competitors we have invested in high-tech cutting machines to ensure your foam is cut both accurately and extremely neatly. See our cutting machines in action in the video below.

Terms such as Heavy or High density Premium or General are just descriptions they mean nothing, if you check foam specification (this should always be detailed or available by phone from reputable companies) you will often find suppliers are using the same density foam for more than one grade and describe 35kg/m³ foams as Heavy or High density.

So what is Latex Foam? We've probably all heard of Latex, and there may well be latex in your mattress at home. Here's where I go into detail about exactly what Latex foam is, its invention, its uses in the mattress and pillow industry, the advantages, disadvantages, comparison, and more.

Latex foam is a rubber compound widely used in mattresses. Sourced from the rubber tree *Hevea Brasiliensis* and manufactured using two methods. The Dunlop method involves pouring into a mold. The Talalay method has additional steps and ingredients, and vacuum techniques to produce a less dense foam.

Latex is now heavily used in the production of mattresses and pillows. A latex mattress is usually combined with either reflex, memory foam, or springs and other layers, in order to create a more supportive, durable, and comfortable sleeping surface for the user.
