

Liberia tesla powerwall

Liberia tesla powerwall

Tesla's Powerwall+ system is essentially an inverter and a solar battery (Powerwall 2) bundled together -- think of it as a two-for-one deal. The Powerwall+ allows your inverter and battery to better communicate while also handling a higher surge capacity during outages.

Tesla has announced the Powerwall 3, but we unfortunately still don't know its release date. Industry experts predict Tesla will offer it sometime in 2023. However, there's speculation that homeowners will have to wait around a year to install it after purchase due to high demand versus the available supply upon release.

But remember -- the Tesla Powerwall loses about 30% of its battery capacity within the first 10 years. So even if your battery lasts longer than the average time, its performance will slightly decline over the years.

Purchasing a Tesla Powerwall has many benefits. Tesla is a reputable company with product specs that match what many solar users want and need. And with solar becoming increasingly popular, it makes sense to have a backup battery for home alongside your solar panel system.

Installing a Tesla Powerwall costs about \$18,000 before you apply tax credits (read our article on the solar investment tax credit [ITC] for more info). Local solar rebates and incentives also further offset the total cost.

In short, solar panels absorb the sun's energy and convert it into usable electricity for your home. Any excess power that your home doesn't use (think lighting and appliances) goes to your solar battery for storage (in this case, a Tesla Powerwall).

But let's say you have a big family, own a large home and use more energy-dependent appliances than most other homes. You might need more than one Powerwall. Even if you use all the energy stored in a single Powerwall, you can still source energy from the grid.

However, if you want greater energy independence, then you might want to invest in two to three Powerwalls. This investment ensures any excess power that your solar panels generate is stored and ready for use -- and it doesn't go back to the grid.

A Tesla Powerwall does what any other backup battery for home does, it stores excess energy from your solar panels. But its ability to support larger energy loads is what really sets it apart from other solar battery brands.

You can use that stored energy at night when your panels aren't producing energy. Additionally, you can use stored energy during power outages when the grid is down. Batteries also come in handy during the winter months, when there's less sunlight because the days are shorter.

Each Powerwall can deliver 21 amps of energy, and you can stack a total of six Powerwalls together. Most homes don't need more than one. Nonetheless, buying two or three is now becoming more common due to power outages and a greater desire to go solar and be energy independent.

Note: Stored energy is more effective at powering smaller, energy-efficient homes and appliances. Their lower consumption needs and higher efficiency ratings allow you to get the most use out of stored power. And remember, your panels' solar energy generation won't recharge the battery at the same pace you consume energy.
