Lithium titanate battery voltage

Lithium titanate battery voltage

Enhanced Safety and StabilityLTO batteries offer superior safety compared to other lithium-ion batteries due to their higher potential compared to pure metal lithium, making them less prone to forming lithium dendrites. This leads to stable discharge voltages and significantly improved safety performance. Rigorous testing, including puncture, crush, and short-circuit tests, has shown that LTO batteries do not emit smoke, catch fire, or explode, marking a substantial safety advantage over other lithium batteries.

Exceptional Fast Charging CapabilitiesOne of the standout features of LTO batteries is their excellent fast charging performance. Thanks to the higher lithium-ion diffusion coefficient in lithium titanate compared to traditional carbon anode materials, LTO batteries can be charged and discharged at high rates. This not only drastically reduces charging time—often to just about ten minutes—but also has minimal impact on the cycle life and thermal stability of the battery.

Extended Cycle LifeLTO batteries boast an extraordinary cycle life, capable of more than 30,000 full charge and discharge cycles. After serving for approximately 10 years as a power battery, they can transition to energy storage applications for an additional 20 years, virtually eliminating the need for replacement and significantly reducing long-term costs.

Superior Temperature ToleranceLTO batteries perform well across a wide temperature range, making them particularly suited for extreme conditions. While most electric vehicle batteries struggle with charging and discharging below -10°C, LTO batteries can function normally from -50°C to -60°C. This wide temperature tolerance ensures reliable performance in both frigid northern climates and the sweltering heat of southern regions, alleviating users" concerns about battery performance under extreme conditions.

When comparing LTO batteries to LFP batteries, it's clear that each has its pros and cons. LTO batteries are about 3 to 5 times more expensive than LFP batteries. However, LTO batteries offer a lifespan that is 6 to 8 times longer than LFP batteries. Thus, for applications where longevity and performance under extreme conditions are crucial, LTO batteries may be the superior choice despite their higher initial cost.

LTO batteries are engineered for durability, with a design life of around 30,000 full depth-of-discharge cycles. This longevity translates to a lifespan of up to 30 years, which is significantly longer than most other lithium-ion battery technologies.

Generally, LTO batteries are on the pricier side, with costs driven up by high production expenses and stringent humidity control requirements. The average cost of LTO battery cells is about \$1.5 USD per watt-hour, while comparable lithium iron phosphate and ternary lithium battery cells are priced at roughly \$0.4 USD per watt-hour.
