

Netherlands solar energy for homes

Want to buy solar panels? And do you want to know more about it? On this site you will find all sorts of information on this subject. You can see what the costs are, the potential yield, the payback time, info about installing and maintaining the panels, subsidy, VAT, solar water heaters, solar collectors, heat pumps and much more!

Solar panels (also called PV panels) convert sunlight into electricity. They consist of several solar cells that capture daylight and convert it into alternating current using an inverter. The panels do not necessarily need direct sunlight to generate electricity. A panel can also generate electricity on a cloudy day. Many millions have been installed in the Netherlands in recent years.

Due to the sharp increase in energy prices, solar panels are currently hard to come by. Unlike heat pumps, solar panels are currently sufficiently stocked. The problem, however, is a shortage of installers to put the panels on the roofs. Installers are talking about a five-fold increase in demand for solar panels in early 2022 compared with autumn 2021.

When solar panels are connected to the electricity grid, this is called a grid-connected PV system. Such a system is generally used for homes and businesses. Surplus electricity – which is not used within the house or building – can be fed back into the electricity network.

Via the net metering scheme, for small consumers (with a main fuse of no more than 3 x 80 ampere), this is offset against the electricity that is purchased from the energy supplier. In 2023 (was first 2020), this net metering scheme will be replaced by a subsidy for feed-in tariffs. For large-scale consumers, there are other incentive schemes, such as the SDE+ scheme.

When it comes to supplying power back to the grid, there are enormous differences between the various energy suppliers. Not only does one supplier calculate an amount including VAT and the other excluding VAT, the amount that you receive back per delivered kWh also differs considerably.

Where Main Energie pays only EUR 0.03 for the off-peak tariff, Pure Energie gives you EUR 0.12 per kWh for the first 1,500 kWh that you feed back. That makes it extra interesting to shop around carefully as an ‘electricity producer’.

Apart from the large differences in compensation, the energy suppliers also deal with the balancing regime differently. One settles the kWh supplied against the off-peak tariff first, the other against the high tariff. Finally, everyone has to pay a monthly fee, the fixed delivery charge, which varies with each supplier. The cheapest charges EUR 2.42 per month, the most expensive EUR 8.75 with a model contract.

Netherlands solar energy for homes

More independent, reliable and practical information about solar panels can be found at the information organisation Milieu Centraal. This organisation was set up in 1998 on the recommendation of central government.

All the information you need is available on the central organisation's solar panel portal. Milieu Centraal also collaborated with Holland Solar, the trade association for the Dutch solar energy sector. The portal provides the information you need as a home owner, tenant, member of an association of owners (VvE) or small and medium-sized enterprise (SME).

In addition, you can visit the 'Verbeterjehuis' website, which is part of the national promotional campaign of the government with the same name. This campaign focuses on private homeowners and VvEs.

The benefits are clear. More and more people are becoming aware that it is important that we deal with our energy in a different way. By using solar panels you contribute to a better environment. Solar energy is sustainable energy, an inexhaustible source. Moreover, no CO2 is released in the production of solar energy.
