

Off grid generator diy

Off grid generator diy

For many homesteaders, the dream is not just to have a homestead of your own but to have one that is completely self-sufficient: totally off-grid! I know it sounds like an impossibility in our increasingly connected world, but I can assure you it is doable.

Better yet, you can do it without giving up that most essential modern amenity: electricity. Whether you want to run a few crucial appliances and tools or keep your house powered up more or less like you always have, you've got options.

And even if you don't care about cutting the cord entirely, it's a good idea to have your own power generation capability in case of disaster. Whatever camp you fall into, keep reading, and I'll tell you about 8 proven and reliable ways to make your own power below.

This is the first thing most homesteaders will think of, and something a lot of us have already. Whether your generator is powered by gasoline, diesel, or propane, it's the perfect solution for running tools and a few appliances or even powering your whole home.

Generators come in many different sizes with drastically differing capabilities. More portable units, commonly called job site generators, do just what the name implies, supplying power to a few high-drain devices or multiple smaller ones.

The upside of generators is that they are readily available, reasonably affordable to obtain and install, and an easily understood, reliable technology--one that can supply you with plenty of electricity.

One of the most prolific and, in many ways, best sources of off-grid power. Solar panels come in all shapes and sizes and are perfect to get into making your own off-grid electricity--and doing so quietly and safely!

Smaller panels can be used to run electric fencing, lighting, and low-drain appliances and tools, while larger arrays can power an entire house; if you cut out power-hogging devices like electric heaters, clothes dryers, and so on.

Once a solar system is set up, it's easy to maintain, and there's certainly no shortage of sunlight in most places, making it a versatile option. Although it will always do best in areas that have long days, get lots of sun, and few clouds, even a small solar array is worthwhile in most places.

These will only give you power when the sun is out and shining, the arrays must be oriented directly at the sun for the best results, and you've got to combine these with a battery system to cover peak demand in many cases.

Off grid generator diy

Another clean, green, and fairly popular choice for off-grid power. Wind turbines are nowhere near being a good solution for power generation at scale or a viable replacement for coal or gas at the societal level, but they definitely have perks for our purposes.

Carefully assess your property for wind patterns, obstacles, and seasonal changes before you commit to even a small wind turbine system; they can be expensive, as can maintenance and periodic replacement parts!
