

Off grid generator size chart

Off grid generator size chart

The hardest part about buying a generator is working out what size wattage generator you'll need. It can be a little overwhelming to understand some of the technical jargon. We are here to simplify the process for you!

As you can see from the example above the total running Wattage is 2840 Watts. However, you will need to account for the start-up wattage which is 2000 Watts. Therefore you'll need to purchase a portable generator that is 4840 Watts or bigger.

Here is a selection of the biggest and best portable generators 4000 watts or bigger. These bad boys will be able to cope with most of your power needs for Power outages at home, welding and are perfect for RV and Campers.

Air conditioners make a huge difference in comfort when the power is out. Having a backup generator that can run your AC is an important consideration. Air conditioners come in many sizes and power capacities. Choosing the right one will take a bit of research and some math. As a general rule, you should choose [...]

Off-grid solar systems usually have solar panels connected to a charge controller connected to a bank of batteries. Solar power systems can be set up in several configurations. The traditional off-grid system has solar panels, charge controller, battery monitoring system, and batteries. The solar panels collect the energy and pass it through the charge controller [...]

Solar trickle chargers are designed to keep batteries in infrequently used vehicles or batteries. Trickle chargers do not generally produce enough energy to overcharge a battery, but if you will not have access to check on your battery, place a solar charge controller between the trickle charger and the battery. Trickle chargers tend to produce [...]
