

Paraguay microgrid development

Paraguay microgrid development

Paraguay, a country in the middle of South America, is in a unique position to develop its economy thanks to two significant opportunities: an energy surplus through 3 hydroelectric dams (Itaipu, Yacyretu, and Acaray), and a demographic bonus since 25,8% of its population is between 15 and 29 years old. This situation provides Paraguay with the perfect conditions to use its resources toward development and growth in productivity.

Committed to enabling this development, Penguin will build the necessary infrastructure for high-performance computing data centers in Hernandarias (Alto Paran), including a substation to deliver the contracted energy from the Hernandarias Industrial Park Substation (PIH).

Since 2019, Penguin has trained more than 2,000 people in programming and coding. Bjorn explains that Penguin's goal is to be able to hire them in the short term for jobs in the technology sector, which have been and will continue to be in growing demand globally.
