

## Retail store energy storage sucre

This guide for retailers introduces the main energy saving opportunities for businesses within the retail sector and demonstrates how simple actions save energy, cut costs and increase profit margins.

In the busy world of retail, where every penny counts, optimising energy efficiency can make a significant difference. For energy decision-makers in the retail industry, the pursuit of sustainability and cost reduction is more relevant now than ever.

In this blog, we will explore the energy landscape in the retail sector and provide tips on how to enhance energy efficiency. We will delve into the considerations unique to this sector, targeting specific roles, and addressing the issues of cost reduction, and sustainability, while keeping customer experience at the forefront.

The retail industry is a vital component of any country's economic success, but its energy consumption is substantial. Understanding the energy dynamics in this sector is essential to making informed decisions about improvements.

According to the British Retail Consortium (BRC), the UK's retail sector accounts for 5% of the nation's energy use. Retailers spend approximately £3.3 billion on energy each year. To put this in perspective, the average retail store consumes 15 times more energy per square foot than a typical office building. This statistic underscores the critically important issue of energy efficiency in the retail sector.

Retail units are known for their bright, welcoming atmosphere, but the lighting required to achieve this can be substantial. The use of traditional incandescent and fluorescent lights is far less efficient than their LED counterparts, using significantly more energy to run for hours at a time.

No shopper wants to feel goosebumps when they enter a store so maintaining a comfortable environment for shoppers is crucial, which often requires substantial heating in the winter and cooling in the summer. Inefficient HVAC systems and poorly insulated buildings can lead to energy waste at all times of the year.

Now that we've identified issues that can lead to high energy costs, let's explore some of the ways you can improve energy efficiency in the retail sector, aligning with the target roles and considerations specific to the industry.

For Supply Chain Operations Managers and Commercial Directors, optimising load shifting is a strategic approach. By carrying out energy-intensive tasks during off-peak hours, retailers can take advantage of lower energy rates. This might involve scheduling inventory restocking or maintenance activities during non-peak times.

## Retail store energy storage succe

Controlling heating based on location and external temperatures is a game-changer. Adapting heating settings depending on factors like weather and store location can lead to significant energy savings. For example, in winter, if the retail store is accessible directly from outside as opposed to something like a store in a shopping centre heating may not need to be as high as customers are likely to be wearing coats.

Directors of Purchasing and Group Purchasing Managers can focus on developing and implementing an energy efficiency strategy. This strategy should encompass goals, guidelines, and performance metrics to drive improvements continuously.

Transitioning to renewable energy sources, such as solar panels or wind turbines, can help retailers move closer to sustainability goals and reduce costs in the long run. This initiative aligns with the wider industry's sustainability and net-zero objectives.
