

Solid-state batteries sri lanka

Solid-state batteries sri lanka

Easy to use solid state relay module with 5V operation, no additional relay driving circuitry is required, can be triggered directly from logic level signals. Can switch up to 240 VAC at 2A current level. LED indication of ON relay is also given on the module board. SSR gives better performance with respect to traditional coil based relay as they are no mechanical parts inside, no chances of mechanical wear and tear. Long life relay with quite operation, no relay ticking sound.

I'm the kind of guy who likes to wash his own car. It takes about an hour of sweat-soaked, grime-nailed work but at the end of it, I have a car that I can unashamedly get in and drive. It's such a shame that me washing the car looks a lot like a damned rain-dance. One such productive morning, having detailed my ride, I showered, shaved, dressed and got into the car, pushed the start button and - nothing. After much troubleshooting (cars these days have got too smart for their own good), it was determined that the battery was at fault.

Suitable for wet ash and high corrosion-proof requirements of the harsh environment, and the occasion of frequent switch, instead of the electromechanical relay is widely used in digital program-controlled devices, temperature control device, data processing system, and computer terminal interface circuit
