

# Types of solar inverter

## Types of solar inverter

To recap, there are three kinds of inverters: string inverters, microinverters, and power optimizers. They all transform the power your solar panels generate from direct current (DC) to alternating current (AC)....

Your home is wired to conduct alternating current (AC) power. The electricity produced by solar panels is initially a direct current (DC). Inverters change the raw DC power into AC power so your lamp can use it to light up the room.

This is a standard inverter, and it works just fine if you don't have any encroaching shade from nearby trees or a big chimney. It's also great if you have all of your solar panels facing the same direction.

This gives each panel the ability to function at peak performance, independent from its neighbors. Even if the panel next to it has a tree branch shading it for most of the day, all the other panels can convert at full capacity. Any drop in efficiency only affects one panel.

Microinverters also enable you to monitor the performance of each individual panel. This is helpful for spotting any issues with a single panel so you can have it repaired before it slows down the whole system's productivity.

Microinverters also make it easy to increase power usage if you want to. Say you buy an electric car and you'll need more power to charge it every night. Adding more solar panels and inverters is easier and less expensive than adding an additional central inverter for a string inverter system.

As with micro-inverters, power optimizers have a component (the "optimizer") underneath and within each solar panel. But rather than change the DC to AC right there on site, these inverters optimize the current before sending it to one central inverter.

Imagine being able to cut to the front of the line at the currency exchange office. It's not quite as quick or convenient as having your own exchange office a few steps from your home, but there's no waiting around once you get to the central office.

Most people feel more comfortable purchasing electronic devices with warranties. Solar inverters are no exception. Most inverters have warranties ranging from anywhere between 5 and 10 years, though some can be extended to 25 years.

When you're looking at a company, make sure you know what's included in the warranty and what's not. For example, some power optimizers might not include the central inverter under the warranty.
