Uk company solar power in ghana

Environmental campaign groups, ClientEarth, the Good Law Project and Friends of the Earth took legal action against the government, fearing their budget delivery plan would not help the UK reach its goal of cutting emissions by two-thirds before 2030.

They've recently unveiled big plans to transform the Port of Newport into a "clean growth hub". The idea is to make decade-long investments in solar energy and wind power to make the transport of goods more efficient (and sustainable!)

To drive efficiency across their estate, the M& S Energy Society installed solar panels on 8 of its host buildings, including Banbury Gateway, Longbridge and Cheshire Oaks here in the North West.

Amazon has been making headlines for their commitment to solar energy. In January of 2024, the world's largest online retailer also became the world's largest corporate purchaser of renewable energy for the fourth consecutive year!

However, it's unsurprising the global giant clinched this title. Amazon has ambitious goals to roll out 30,000 modular solar panels across key UK facilities in Bristol, Manchester and Milton Keynes.

2023 saw the company install solar panel systems on 15 of its European facilities and in 2024, Amazon has pledged to invest in even more on-site renewables, like rooftop solar systems and utility-scale solar projects.

They opened the UK's largest carport and energy storage facilities in their Perth office, with support from the Scottish government. The installation includes 3,238 solar PV panels, which are set to generate 812,000kWh!

As a leader in global research and education, Cambridge University Press has committed to reducing its carbon emissions. Their goal is to reach carbon neutrality by 2040, with a target of at least 72% by 2030.

To do this, the company has been replacing gas boilers with electric alternatives (which led to an estimated 10 tonnes of carbon savings), improving energy management and replacing ventilation pumps.

IKEA's "climate-positive" approach to business has seen the company form their very own sustainability strategy. By 2030, the Swedish manufacturers want to reduce more greenhouse gas emissions than the full IKEA value chain emits.

They offer partners two ways to convert: by facilitating the purchase of renewable electricity and financing on-site investments. IKEA's US and Australia stores have also been at the vanguard of the company's push into solar.

Tesco was the first company to set a zero-carbon goal back in 2009. They've since reduced their carbon emissions by 55%! It's no surprise the company aims to be carbon neutral by 2035 and net zero by 2050. But what's their plan?
