

Uninterrupted power supply cost

Uninterrupted power supply cost

UPS stands for uninterruptible power supply, it's a device that acts as a battery backup in case of an electrical power failure. Small UPS machines for homes and offices supply enough power for a few minutes, so there's time to turn off devices properly without losing any work. Larger UPS systems can even last a few hours, but you generally won't find these in homes or small offices.

When choosing a UPS for yourself, start with considering where you're going to use it — for your home or office? If it's a small home or office that you need to power, then a tiny UPS will work fine.

You'll want to evaluate the size and form of the UPS system. While some are compact and can be fit on desks, others are larger and either in the form of towers or rack-mounts. There are some UPS machines that can be used both as towers or rack-mounts.

The best UPS (uninterruptible power supply) devices on this page are important purchases for any business - or home user - who needs electronic devices such as PCs and servers that have constant power connections 24 hours a day, seven days a week.

If there's a power cut, even a very brief one, then the results can be catastrophic, as servers could become unreachable, and data could even be corrupted if a computer shuts down suddenly.

That's where the best UPS come in, as if there's a power cut, they will seamlessly switch to battery power, and your devices will remain on and running until the main power is restored, or you can safely shut down the device.

These days many of us are working from home, so buying the best UPS your budget can stretch to is even more important. You may find that you're plugging in a lot more power-hungry devices into your home power supply, and this could lead to power cuts or power surges. Your home likely won't have the power backup solutions that your office does, so buying a UPS for your home could be a very wise investment.

We've compared these UPS devices across many factors, like their size, power supply, runtime, and battery recharging time. We looked at what types of environments they'd be best suited for and their input voltage and outlets, among other things.

If you are after a cheaper, and more simple, UPS device, then the APC Back-UPS ES - BE700G is a great choice. We would not recommend it for large businesses with lots of mission-critical computers and servers, but it offers plenty of power for homes and small businesses to keep their devices going when the power fails.

This UPS from APC has eight surge-protected power sockets, four of which are covered by the battery

Uninterrupted power supply cost

backup. All of the eight sockets can take standard three-pin plugs, making it more convenient than the kettle leads found on some UPS systems. You will have enough UPS sockets for your Mac, monitor, and essential peripherals like an external hard drive or router.

The CyberPower CP1500EPFCLCD is an excellent UPS for home and small business use. It comes with a decent amount of ports, as well as USB, for plugging in your devices. RJ11/RJ45 ports keep your phone, fax and modem lines protected from power surges, and it comes with a number of energy-saving features to prevent it from wasting energy when in use.

Ideal for keeping mid and high-end computer systems safe, the UPS comes with Automatic Voltage Regulation (AVR) to ensure safe voltage levels for all devices that are connected. It has featured data line protection that protects communication and network equipment from power surges and spikes.
