United states industrial microgrids

Through these investments, the Biden-Harris Administration is working to:Expand capacity and unlock renewable energy resources:Electrifying homes, buildings, and vehicles will reduce greenhouse gas emissions and reducing costs.

Reduce the frequency and duration of power outages:Investments in grid hardening--like strengthening critical transmission lines, hardening electric poles with stronger materials, and improving flood mitigation--will ensure that communities have power when natural disaster strikes and that power outages do not last long when they do occur. Recently announced investments will also support more than 400 microgrids, which can continue to operate if the main grid is affected by an extreme weather event.

Mitigate risk of wildfire:By investing in projects that move overhead power lines that are threatened by high winds or heavy snow, removing hazard trees, and making technology-based upgrades and improvements, utilities can better predict when and where there are high-risk conditions for wildfires, better detect wildfires earlier on, and reduce the need to proactively shut off power in regions that are at-risk for wildfires.

We'll be in touch with the latest information on how President Biden and his administration are working for the American people, as well as ways you can get involved and help our country build back better.
