According to data from the International Energy Agency, Albania, Bhutan, Nepal, Paraguay, Iceland, Ethiopia and Congo generate more than 99.7% of their electricity from renewables his recent apostolic letter, Fratello Sole (Brother Sun), Pope Francis has initiated the construction of a "agrivoltaic system" within the extraterritorial area of Santa Maria di Galeria.

"There is a need to make a transition to a sustainable development model that reduces greenhouse gas emissions into the atmosphere, setting the goal of climate neutrality. Humanity has the technological means to deal with this environmental transformation and its pernicious ethical, social, economic and political consequences, and, among these, solar energy plays a fundamental role," the letter read.

The Vatican is extremely small and, as such, it's not a huge stretch for it to generate its own power. In 2022 the Vatican's emissions were around 0.0000443% of the global total, but the Pope wants to show that the state is taking a stand on climate change.

The Pope is an outspoken supporter of the United Nations Framework Convention on Climate Change of 1992, which the Vatican joined in 2022, and aims to address "dangerous human interference with the climate system".

The Vatican has already put a number of steps in place over the years to reduce its carbon footprint. For example, it introduced a recycling system in 2016 to reduce waste and pollution. Then in 2023 it partnered with Volkswagen to introduce an all-electric car fleet to reduce the state's carbon footprint.

"It is very difficult to create an awareness of this," he said. "[World leaders] hold a conference, everybody is in agreement, they all sign, and then bye-bye. But we have to be very clear, global warming is alarming."
