Finding Local Peak and Off-Peak Hours
Now Let's Talk About Finding Your Peak Plan

It's all about demand. Peak Hours refer to times when the demand for electricity is highest. Typically, this is during the middle of the day and early evening. Due to the higher demand, electricity is more expensive during these hours. In Texas, for example, peak hours often occur from early afternoon until the evening (approximately 1 PM to 5 PM), depending on the time of year and specific location.

Off-peak hours are when the demand for electricity drops, and thus, the cost is lower. This usually includes nighttime and early morning hours. For instance, in Texas, off-peak hours might start from late evening until early morning (around 9 PM to 5 AM).

Electricity rates during peak hours can be significantly higher compared to off-peak hours. By understanding these variations, consumers can shift their high-energy usage activities to off-peak times, thereby reducing their overall energy costs.

Many energy providers offer Time of Use (TOU) plans that provide lower rates during off-peak hours and higher rates during peak hours. These plans are suitable for consumers who can adjust their energy consumption based on the time of day.

Utility companies like to offer TOU plans to incentivize consumers to use energy during off-peak hours. This is because they are worried about putting too much stress on the electrical grid during times of high demand. Also, if demand ever exceeds the current electrical supply, it's on the utility company to buy excess electricity from elsewhere or produce additional electricity in advance to prepare for that high demand.

To find specific peak and off-peak hours for your area in your state, you should first check with your local utility provider or energy company. They can provide the most accurate and up-to-date information regarding time-of-use rates and help you decide if a TOU plan is right for you.

The chart below, however, will give you a rough idea of Peak and Off-Peak Hours for the different time zones in the U.S. There are two charts, one for summer and one for winter, as the change in weather and daylight

hours affects human behavior and electricity demand.

By strategically managing your electricity usage according to peak and off-peak schedules, you can save on costs and contribute to reducing the overall demand on the power grid during high usage times, which is beneficial for environmental sustainability.

Whether you're looking to take advantage of off-peak rates or find a Time of Use plan that suits your lifestyle, ElectricityRates offers a comprehensive platform to help you navigate the complexities of your local energy market.
